

ABSTRACT OF THE DISCLOSURE

A seal plate includes tear out sections that leave pipe sealing openings, an externally threaded cylindrical portion that extends through a hole in a septic system distribution box wall, a resilient cup-shaped flange that faces one side of the wall around the hole, an internally threaded ring with hand grips that is screwed onto the cylindrical portion against the other side of the wall so that the wall is clamped between the ring and the cup-shaped flange and the flange bends axially, resiliently forcing concentric radially spaced axially extending ridges on the cup shape flange sealingly against the wall.
